Gaming Engagement Analytics & Developer Action Report

Dataset records analyzed: 40,034
Game genres analyzed: 5

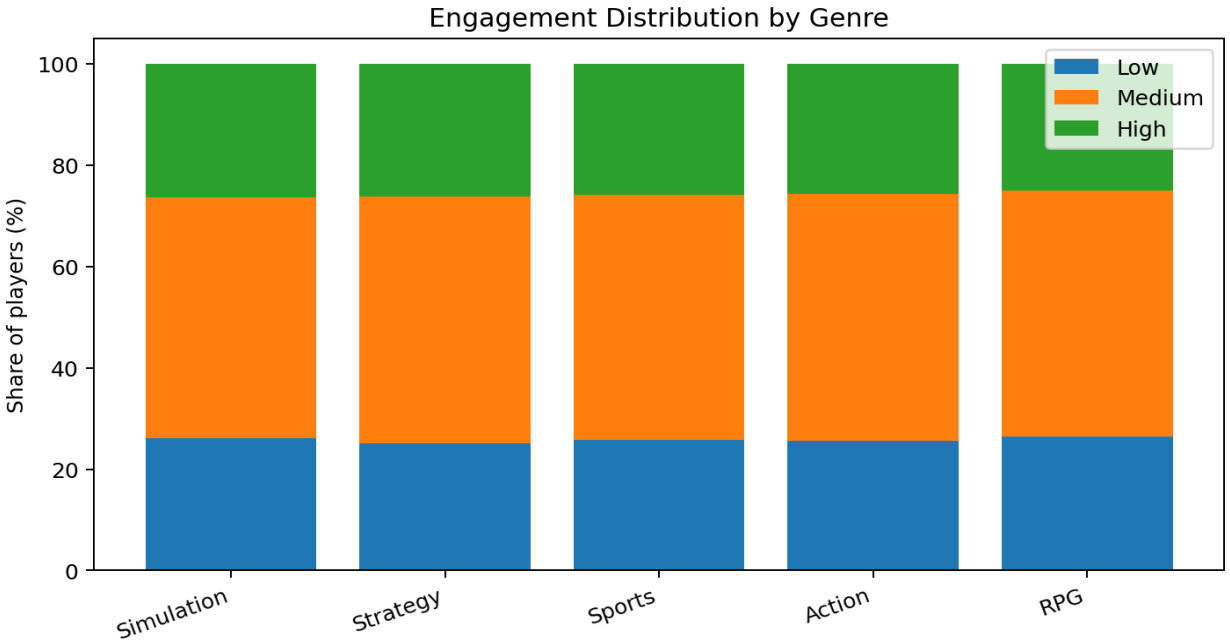

Executive Summary

This report compares observed Low, Medium, and High engagement labels across game genres. The percentages describe this dataset; they do not prove that genre causes engagement or predicts commercial success. Use the findings to guide player research and controlled tests.

High Engagement by Genre

Engagement Distribution by Genre

Genre Metrics

Genre	Players	High (%)	Medium (%)	Low (%)
Simulation	7,983	26.4	47.5	26.2
Strategy	8,012	26.2	48.8	25.0
Sports	8,048	25.9	48.3	25.8
Action	8,039	25.7	48.7	25.6
RPG	7,952	25.0	48.6	26.4

Genre-Specific Developer Requirements

Simulation: Explore successful mechanics

Players: 7,983 **High engagement:** 26.4% **Low engagement:** 26.2%

Review missions, sandbox activities, and progression loops associated with stronger engagement. Prototype optional scenarios while preserving the existing core experience.

Strategy: Test onboarding and balance

Players: 8,012 **High engagement:** 26.2% **Low engagement:** 25.0%

Examine tutorial clarity, strategic depth, match pacing, and balance feedback. Test clearer objectives or onboarding improvements with a small player group.

Sports: Improve match experience

Players: 8,048 **High engagement:** 25.9% **Low engagement:** 25.8%

Collect feedback on match length, controls, fairness, and replay value. Test one focused improvement, such as matchmaking or a short challenge mode, before expanding it.

Action: Review pacing and difficulty

Players: 8,039 **High engagement:** 25.7% **Low engagement:** 25.6%

Review combat difficulty, level pacing, checkpoints, and repetition. Playtest targeted adjustments without replacing the core gameplay.

RPG: Investigate low engagement

Players: 7,952 **High engagement:** 25.0% **Low engagement:** 26.4%

Keep the existing core game initially. Investigate quest clarity, repetitive grinding, reward pacing, and character progression. Prioritize player-reported problems before changing major systems.

Recommended Evaluation Plan

1. Review player feedback and available session behavior for each genre.
2. Prototype optional content or new scenarios where engagement appears stronger.
3. Preserve existing core gameplay while investigating lower-engagement patterns.
4. Measure return rate, session frequency, completion, satisfaction, and engagement after changes.
5. Scale only changes supported by playtests or controlled experiments.

Limitation: The engagement labels do not establish whether an individual player's engagement is declining over time. Longitudinal session data and controlled experiments are needed to evaluate declining engagement and the effects of game-design changes.
